www.sonotronndt.com
EC Declaration of Conformity

Directive 93/68/EEC

We, Sonotron NDT Ltd., 4 Pekeris Street, Rehovot, 76702 Israel, certify that the product
described is in conformity with the Directives 73/23/EEC and 89/336/EEC as amended

ISONIC PA AUT
Portable Digital Platform for Automatic Ultrasonic Flaw Detection and Recording
Combining Phased Array, TOFD, and Conventional Pulse Echo Techniques

The product identified above complies with the requirements of above EU directives by
meeting the following standards:

Safety
EN 61010-1:2001

EMC
EN 61326-1:2006
EN 61000-3-2:2006
EN 61000-3-3:1995
Declaration of Compliance

We, Sonotron NDT Ltd., 4 Pekers Street, Rehovot, 76702 Israel certify that the product described is in conformity with National and International Codes as amended

ISONIC PA AUT
Portable Platform Digital for Automatic Ultrasonic Flaw Detection and Recording Combining Phased Array, TOFD, and Conventional Pulse Echo Techniques

The product identified above complies with the requirements of following National and International Codes:

- ASME Code Case 2541 – Use of Manual Phased Array Ultrasonic Examination Section V
- ASME Code Case 2557 – Use of Manual Phased Array S-Scan Ultrasonic Examination Section V per Article 4 Section V
- ASME Code Case 2558 – Use of Manual Phased Array E-Scan Ultrasonic Examination Section V per Article 4 Section V
- ASME Section I – Rules for Construction of Power Boilers
- ASME Section VIII, Division 1 – Rules for Construction of Pressure Vessels
- ASME Section VIII, Division 2 – Rules for Construction of Pressure Vessels. Alternative Rules
- ASME Section VIII Article KE-3 – Examination of Welds and Acceptance Criteria
- ASME Code Case 2235 Rev 9 – Use of Ultrasonic Examination in Lieu of Radiography
- Non-Destructive Examination of Welded Joints – Ultrasonic Examination of Welded Joints. – British and European Standard BS EN 1714:1998
- Non-Destructive Examination of Welds – Ultrasonic Examination – Characterization of Indications in Welds. – British and European Standard BS EN 1713:1998
FCC Rules

This ISONIC PA AUT Portable Digital Automatic Ultrasonic Flaw Detection and Recording System Combining Phased Array, TOFD, and Conventional Pulse Echo Techniques (hereinafter called ISONIC PA AUT) has been tested and found to comply with the limits for a Class B digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

- Reorient or relocate the receiving antenna
- Increase the separation between the equipment and receiver
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected
- Consult the dealer or an experienced radio/TV technician for help

Safety Regulations

Please read this section carefully and observe the regulations in order to ensure your safety and operate the system as intended.

Please observe the warnings and notes printed in this manual and on the unit.

The ISONIC PA AUT has been built and tested according to the regulations specified in EN60950/VDE0805. It was in perfect working condition on leaving the manufacturer’s premises.

In order to retain this standard and to avoid any risk in operating the equipment, the user must make sure to comply with any hints and warnings included in this manual.

Depending on the power supply the ISONIC PA AUT complies with protection class I /protective grounding/, protection class II, or protection class III.

Exemption from statutory liability for accidents

The manufacturer shall be exempt from statutory liability for accidents in the case of non-observance of the safety regulations by any operating person.

Limitation of Liability

The manufacturer shall assume no warranty during the warranty period if the equipment is operated without observing the safety regulations. In any such case, manufacturer shall be exempt from statutory liability for accidents resulting from any operation.

Exemption from warranty

The manufacturer shall be exempt from any warranty obligations in case of the non-observance of the safety regulations.

The manufacturer will only warrant safety, reliability, and performance of the ISONIC PA AUT if the following safety regulations are closely observed:

- Setting up, expansions, re-adjustments, alterations, and repairs must only be carried out by persons who have been authorized by the manufacturer.
- The electric installations of the room where the equipment is to be set up must be in accordance with IEC requirements.
- The equipment must be operated in accordance with the instructions.
- Any expansions to the equipment must comply with the legal requirements, as well as with the specifications for the unit concerned.
- Confirm the rated voltage of your ISONIC PA AUT matches the voltage of your power outlet.
- The mains socket must be located close to the system and must be easily accessible.
- Use only the power cord furnished with your ISONIC PA AUT and a properly grounded outlet /only protection class I/.
- Do not connect the ISONIC PA AUT to power bar supplying already other devices. Do not use an extension power cord.
- Any interruption to the PE conductor, either internally or externally, or removing the earthed conductor will make the system unsafe to use (only protection class I).
- Any required cable connectors must be screwed to or hooked into the casing.
- The equipment must be disconnected from mains before opening.
- To interrupt power supply, simply disconnect from the mains.
- Any balancing, maintenance, or repair may only be carried out by manufacturer authorized specialists who are familiar with the inherent dangers.
- Both the version and the rated current of any replacement fuse must comply with specifications laid down.
- Using any repaired fuses, or short-circuiting the safety holder is illegal.
- If the equipment has suffered visible damage or if it has stopped working, it must be assumed that it can no longer be operated without any danger. In these cases, the system must be switched off and be safeguarded against accidental use.
- Only use the cables supplied by manufacturer or shielded data cable with shielded connectors at either end.
- Do not drop small objects, such as paper clips, into the ISONIC PA AUT.
- Do not put the ISONIC PA AUT in direct sunlight, near a heater, or near water. Leave space around the ISONIC PA AUT.
- Disconnect the power cord whenever a thunderstorm is nearby. Leaving the power cord connected may damage the ISONIC PA AUT or your property.
When positioning the equipment, external monitor, external keyboard, and external mouse take into account any local or national regulations relating to ergonomic requirements. For example, you should ensure that little or no ambient light is reflected off the external monitor screen as glare, and that the external keyboard is placed in a comfortable position for typing.

- Do not allow any cables, particularly power cords, to trail across the floor, where they can be snagged by people walking past.
- The voltage of the External DC Power Supply below 11 V is not allowed for the ISONIC PA AUT unit.
- The voltage of the External DC Power Supply above 16 V is not allowed for the ISONIC PA AUT unit.

Remember this before:

- balancing
- carrying out maintenance work
- repairing
- exchanging any parts

Please make sure batteries, rechargeable batteries, or a power supply with SELV output supplies power.

Software

ISONIC PA AUT is a software controlled inspection device. Based on present state of the art, software can never be completely free of faults. ISONIC PA AUT should therefore be checked before and after use in order to ensure that the necessary functions operate perfectly in the envisaged combination. If you have any questions about solving problems related to use the ISONIC PA AUT, please contact your local Sonotron NDT representative.

1. Introduction
ISONIC PA AUT from Sonotron NDT represents cutting edge technology platform for high-speed automatic ultrasonic testing of welds, metals, composites, and the like combining phased array and conventional probes.

Regular remote PC connected to instrument ISONIC PA AUT Ethernet provides full control, data acquisition and imaging in real time through the appropriate application software.

ISONIC PA AUT is packed into rugged portable lightweight sealed case, which may be fitted onto the scanner’s chassis avoiding the use of big, expensive, noisy, heavy, and vulnerable analogue umbilical: probes signals are sampled and pre-processed in real time right on the scanner; the digitised raw inspection data is transferred to remote PC for further processing, storage, and imaging. Fully digital through-Ethernet control and data transfer provide practically unlimited length of distance to remote PC enabling flexibility of creating control rooms or multiple monitor stations throughout the barge / factory / weld station, etc.

ISONIC PA AUT platform fully complies with the requirements of National and International Codes:

- ASME Code Case 2541 – Use of Manual Phased Array Ultrasonic Examination Section V
- ASME Code Case 2557 – Use of Manual Phased Array S-Scan Ultrasonic Examination Section V per Article 4 Section V
- ASME Code Case 2558 – Use of Manual Phased Array E-Scan Ultrasonic Examination Section V per Article 4 Section V
- ASME Section I – Rules for Construction of Power Boilers
- ASME Section VIII, Division 1 – Rules for Construction of Pressure Vessels
- ASME Section VIII, Division 2 – Rules for Construction of Pressure Vessels. Alternative Rules
- ASME Section VIII Article KE-3 – Examination of Welds and Acceptance Criteria
- ASME Code Case 2235 Rev 9 – Use of Ultrasonic Examination in Lieu of Radiography
- Non-Destructive Examination of Welded Joints – Ultrasonic Examination of Welded Joints. – British and European Standard BS EN 1714:1998
- Non-Destructive Examination of Welds – Ultrasonic Examination – Characterization of Indications in Welds. – British and European Standard BS EN 1713:1998

3. Operating ISONIC PA AUT Hardware
Please read the following information before you use **ISONIC PA AUT**. It is essential to read and understand the following information so that no errors occur during operation, which could lead damaging of the unit or misinterpretation of inspection results.

### 3.1. Preconditions for ultrasonic testing with ISONIC PA AUT

Operator of **ISONIC AUT** must be certified as at least **Level 2 AUT Examiner** additionally having the adequate knowledge of:

- operating automatic ultrasonic flaw detector
- basics of computer operating in the **Windows™** environment including turning computer on/off, keyboard, touch screen and mouse, starting programs, saving and opening files

3.3.2. ISONIC PA AUT Network Connection

Network configurations described in this chapter to be managed by the local system administrator only. Improper re-configuration of on-board PC of ISONIC PA AUT instrument may affect further network access to it causing the need in interventional repair with extracting of its of flash memory and re-formatting it in the master stand at Sonotron NDT premises, said repair is no covered by warranty.

3.3.2.1. General

On-board satellite computer of ISONIC PA AUT runs under Windows XP Embedded and it is configured to accept standard Microsoft Windows Network Connections.

ISONIC PA AUT allows connection via Remote Desktop Connection, which is an integral part of Microsoft Windows XP. Use of Remote Desktop Connection is required only in limited number of cases when there is a need in full access to on-board satellite computer of ISONIC PA AUT.

The following username and password should be used for any type of network connection to ISONIC PA AUT:

Username: RDGuest
Password: rdguest

Primary TCP/IP Configuration of on-board satellite computer of ISONIC PA AUT is set to DHCP client – the IP Address is obtained automatically upon connection to DHCP Networks.

Alternate TCP/IP Configuration on-board satellite computer of ISONIC PA AUT has the following parameters:

IP Address: 192.168.3.X
Subnet mask: 255.255.255.0
Default Gateway: 192.168.3.1

Where X may be a number from 10 to 19.
3.3.2.2. Connection Via DHCP-Enabled Network – Settings of the Remote Control Computer

![Diagram showing network connections between a computer and an instrument via Ethernet]

You can get IP settings assigned automatically if your network supports this capability. Otherwise, you need to ask your network administrator for the appropriate IP settings.

**General**
- Obtain an IP address automatically
- Use the following IP address:
  - IP address:
  - Subnet mask:
  - Default gateway:
- Obtain DNS server address automatically
- Use the following DNS server addresses:
  - Preferred DNS server:
  - Alternate DNS server:

ISONIC PA AUT from Sonotron NDT – HW Operating Manual – Inspection of Girth Welds – Revision 2.21 - Page 21 of 47
3.3.2.3. Connection Via DHCP-Enabled Mini Router – Settings of the Remote Control Computer
3.3.2.4. Connection Via Crossover Ethernet Cable – Settings of the Remote Control Computer

Y - any number between 20 to 29
3.3.3. Mechanical Fittings

3.3.3.1 HMC-Type Scanners

Fit interface plate to the bottom side of the instrument with 6 screws.
Fit the travel band onto a pipe and the scanner onto the travel band.
Fit instrument into the scanner

Pull and release
Fit the frame for carrying probes into the scanner.
3.3.3.2 SM 80600702-Type Scanner

Fit **interface plate** to the bottom side of the instrument with 6 screws.

Fit **travel band** onto a pipe and **scanner** onto the travel band.
Fit the [frame for carrying probes] into the scanner
Fit instrument into the scanner

Pull and release
3.3.3.3 Fitting Probes and Position Encoder into the Frame

Each probe to be fitted into it's own probe holder. Probes and encoder to be fitted into the frame according to the planned scanning strategy; irrigation piping to be provided for each probe holder.

Encoder to be fitted into the frame by such a way that it's wheel will be oriented at parallel to the travel band.
3.3.4. Turning ISONIC PA AUT On

Complete preparations as per chapters 3.3.1 through 3.3.3 of this Operating Manual then set power switch on the AC/DC converter into I position – an automatic boot up of the on-board satellite computer of ISONIC PA AUT will start, it may take 40…120 seconds.

In the remote control computer start ISONIC PA AUT Inspection software through:

The screen as below appears:
Upon on-board satellite computer of ISONIC PA AUT boots up and the hardware initialization is completed the name of the instrument appears in the list and it’s status of readiness for the operation is indicated as **Idle**.

**Click on** to establish communication between remote control computer and ISONIC PA AUT, the start-up screen appears then:
3.3.5. Turning ISONIC PA AUT Off

To turn off ISONIC PA AUT, click on the 'Turn Off' button in the remote control computer screenshot. Wait until the name of ISONIC PA AUT instrument disappears from the list, then set the power switch on the AC/DC converter into 'O' position.

Remote control computer screenshots related to paragraphs 3.3.4 and 3.3.5 of the present Operating Manual have been made with use of Inspection SW Package for ISONIC PA AUT “Automatic Mechanized Ultrasonic Examination of Girth Welds Using Zonal Discrimination according to ASTM E-1961”. For other SW packages, the ON/OFF procedure is identical.
4. Inspection SW Package: Automatic Mechanized Ultrasonic Examination of Girth Welds Using Zonal Discrimination according to ASTM E-1961
4.1. Pre-scanning Routine – Stage 1: Theoretical Setup Wizard

Theoretical setup wizard is the special SW package that may run in the remote control computer or any other PC. Theoretical rays tracing is necessary to ensure complete insonification of girth weld to be inspected, it is started through:

The screen as below appears then

- Click on to start new ray tracing routine
- Click on to upload data from ray tracing file for previewing / editing
- Click on to exit without saving newly created / edited theoretical setup file
Further operation is performed through intuitive graphic user interface, the stages include:

- **Probe Definition** dialogue for entering parameters of PA probes and wedges
- **Weld Definition** dialogue for selection of appropriate weld bevel from data base and entering related geometry and dimensions.
- **Zones Definition** dialogue for "slicing" of weld volume, cap, hot pass, and root areas into zones to be insonified in each qualified position of PA probe:
Ray Tracing dialogue for determining of zone-by-zone insonification scheme (pulse echo or tandem; incidence angles; emitting and receiving aperture; focal distance) and appropriate positions for PA probes from both sides of the weld (Upstream – Downstream)
On completion theoretical setup file is stored

Movies illustrating examples of the ray tracing routine are available for download at:

4.2. Pre-scanning Routine – Stage 2: Ultrasonic Setup Wizard

Ultrasonic setup is performed on specially manufactured calibration block including a number of artificial reflectors, which's location, orientation, shape, and dimensions represent variety of flaws to be sensed and recorded. Calibration blocks are manufactured for each pipe diameter, wall thickness, weld bevel, etc. by such a way that all defects may be detected and recorded through one revolution scan along the hypothetic fusion line. Typically calibration block is shaped as piece of pipe allowing setup of complete scanning stuff; each section containing artificial defect is appropriately marked on the OD surface of the pipe.
To proceed on connection to the instrument click on

It is necessary to key in OD (outside diameter) of the pipe then and to define positioning of PA probes from both sides of the weld either with or without lateral displacement (LD) and key in LD value if applicable

Virtual joystick semi-transparent control is used to place probes into cross sections containing reference reflectors precisely
The goal of ultrasonic is of appropriate probe either PA, TOFD, or conventional into every predefined position and providing necessary settings (Gain, Gate, Aperture, etc) ensuring detection and resolving of all artificial defects.
It is also necessary to calibrate several focal laws for continuous coupling monitoring for PA and conventional probes as well. For PA probes it is possible to use as coupling reference either longitudinal wave back wall echo or through-transmitted signal between or combination of above techniques, the appropriate dialogue is provided.
Final screen of Ultrasonic Setup Wizard relates to configuration of the strip chart. Strip chart is a method of AUT data presentation whereas each pulsing-receiving shot is continuously recorded into corresponding strip. Reshaping of Strip Chart is possible through manipulating position / lateral displacement of each strip according to the probes fitting into the scanning frame:

Calibration scanning is performed then in automatic mode to ensure that all artificial defects are sensed, resolved, and recorded at proper locations. Ultrasonic Setup Wizard is finished with creation of complete Inspection Setup File; inspection becomes possible at any moment after said file is uploaded into scanning routine. The exemplary sequence of operations for ultrasonic setup wizard is illustrated by the movie available for download at: http://www.sonotronndt.com/PDF/OMPAAUT/U_SETUP.wmv

Movie illustrating example of scanning of calibration block for 273 mm OD pipe is available for download at: http://www.sonotronndt.com/RepInfo/IPAAUT/IPAAUTCalBlockScan01.wmv

Movie illustrating example of screen of remote PC controlling ISONIC PA AUT whilst scanning of calibration block for 273 mm OD pipe is available for download at: http://www.sonotronndt.com/RepInfo/IPAAUT/IPAAUTCalBlockScanScreen01.wmv

Movie illustrating example of scanning of calibration block for 1219 mm OD pipe is available for download at: http://www.sonotronndt.com/RepInfo/IPAAUT/IPAAUTCalBlockScan02.wmv

Movie illustrating example of screen of remote PC controlling ISONIC PA AUT whilst scanning of calibration block for 1219 mm OD pipe is available for download at: http://www.sonotronndt.com/RepInfo/IPAAUT/IPAAUTCalBlockScanScreen02.wmv
4.3. Scanning and Postprocessing

Movies illustrating scanning of girth weld on site are available for download at:

http://www.sonotronndt.com/RepInfo/IPAAUT/IPAUT_70MM_SEC.wmv - for 273 mm OD pipe

http://www.sonotronndt.com/RepInfo/IPAAUT/OD1219.wmv - for 1219 mm OD pipe

Whilst scanning the raw A-Scan data obtained by PA, conventional, and TOFD probes is transferred to remote PC along with corresponding position encoder data. Remote PC provides raw data recording and forms strip chart in real time. Whilst scanning operator may monitor live A-Scans for every strip through clicking on the desired one. Inspection results file compressing complete raw data bulk is created automatically on scanning completed.

At the postprocessing stage it is possible to play back captured A-scans, to mark, size, and evaluate defects, to create defects list, etc.
